

Medusa – Release information

Version 7.04.02

General

Minor bug fixes to version 7.04.

System Requirements - Version 7.04.02

The following system requirements shall be considered:

.NET Framework 4.8

Support for Microsoft SQL Server 2014 or later.

Note!

In line with Microsoft's lifecycle management, the next version of Medusa will require version Microsoft SQL Server 2019 or later.

New links

No new links are introduced in this version.

New permissions

No new permissions are introduced in this version.

New system settings

No new system settings are introduced in this version.

FUNCTIONAL CHANGES IN VERSION 7.04.02

GENERAL

| ID | Classification | Feedback |
|---------------------------|-----------------------|---|
| 39025 | Bug | An error has been corrected where the filter for signatures did not work properly. The problem was caused by the filtered information not being handled correctly in the session cache for the current user. This could lead to filters being mixed up between different users. |
| 25810, 39156, 39155 | Bug | Review of language/translations |
| 38974 | Bug | An error has been corrected where users belonging to multiple user groups, and who had been granted access to these via several different filters (filters on user groups), could receive duplicates — or multiple rows of the same user group — when listing them in dropdown menus. |
| 39013, 38972 | Bug | Search pages that had been restricted by filters could “lose” the filter after making a search or clicking on Clear. |
| 39021 | Bug | An error has been corrected where the widget on the start page displayed user groups incorrectly and with redundancy if the groups were included in more than one filter. |
| 39248 | Changed functionality | Performance improvements have been made to quick search. |
| 39430 | Changed functionality | Additional support has been implemented to prevent cache-related issues in connection with upgrades. The web pages now include cache management via HTTP headers, which ensures that updated content is always correctly loaded after an upgrade. |
| 39452 | Bug | An error has been corrected where MAM (Medusa Upgrade Manager) incorrectly handled virtual paths during upgrade. This affected document paths for certain APIs, which could cause, for example, test results to be stored in the wrong directory. |

WORKORDER

| ID | Classification | Feedback |
|-------|----------------|--|
| 38727 | Bug | When an external party and a contact person at the external party were specified on a work order, more than one record for the current work order could appear in the Work order search. The number of records was linked to the number of contact persons for the respective supplier/external party. |
| 38941 | Bug | During stock withdrawals, the relevant code for the equipment associated with the work order was not applied as a filter in the Article search. |
| 39186 | Bug | The default document type for checklists did not consider the setting for whether the document should be visible in the Customer portal when the checklist was generated as a PDF on the work order. |

ORDER

| ID | Classification | Feedback |
|-------|----------------|--|
| 39457 | Bug | When navigating from equipment to articles (spare parts), and then creating a purchase order from there, the current equipment number was not transferred to the order. This could result in either an error message or an incorrect equipment number. |

PM

| ID | Classification | Feedback |
|-------|----------------|---|
| 35573 | Bug | Isolated, i.e. non-recurring PMs that are linked to PM template on code have not been closed correctly when the PM work order is completed. The error has meant that the PM has been remaining on the equipment. |
| 38808 | Bug | Icon (lorry) to indicate that external service is ongoing has not been displayed in Search PM. |
| 39078 | Bug | Search PM with code as filter entered via autocomplete could give incorrect search results. The problem occurred if the user pressed the search button before the autocomplete process was completed, which was due to issues in the underlying architecture. |

BASIC REGISTER

| ID | Classification | Feedback |
|-------|----------------|---|
| 39466 | Bug | After upgrading to version 7.04.01, dropdown fields for properties on codes have been able to show duplicates - such as risk numbers, user groups, etc. The duplicates occurred after navigating back and forth between the code part name and the code itself. |
| 39311 | Bug | Users could receive error messages during stocktaking when filters were enabled on stock. The problem occurred if ongoing stocktakes contained articles from stocks that the user did not have access to. |

EQUIPMENT/SYSTEMS

| ID | Classification | Feedback |
|-----------------|----------------|---|
| 30661, 38504 | Bug | Searching for equipment/system items with search criteria on attributes was not given correct search results due to the combination of the attribute and the attribute value was not handled correctly. |
| 38699 | Bug | The user group was not handled correctly if it was specified before a code was selected during the registration of new equipment/system. The value from the code overwrote the specified user group even if the code lacked a user group. |
| 39121 | Bug | A maximum of 100 logbook records were incorrectly displayed for equipment/systems instead of showing the total number if there were more than 100. |
| 39443 | Bug | The calculation of the risk score was not handled correctly. The basis for the calculation incorrectly used <i>strDescription</i> instead of <i>intSeverityLevel</i> . |

ADD-ON MODULE: CONTRACT

| ID | Classification | Feedback |
|-------|----------------|--|
| 39267 | Bug | An error message has been displayed when trying to open object rows in a contract that had a system. |

ADD-ON MODULE: ECONOMY

| ID | Classification | Feedback |
|-------|----------------|---|
| 38636 | Bug | When generating invoice data, null entries could be created instead of assigning them the value 0. This resulted that these records not been displayed. |

ADD-ON MODULE: HELPDESK

| ID | Classification | Feedback |
|-------|----------------|--|
| 36890 | Bug | The field for equipment/system on a ticket previously did not clearly indicate when a system had been selected if the selected system lacked a code. The system ID is now displayed. |
| 38166 | Bug | A reference to the current conversation/feedback was not created when documents/attachments were imported via POP3 from email. |
| 38311 | Bug | Email notifications for conversations were not received as expected when the email configuration was of the EWS type. |
| 38950 | Bug | The font used for certain control questions was not consistent with other parts of Medusa. |
| 39144 | Bug | Improved performance when selecting equipment/system for a ticket, both in the Customer portal and internally. |
| 39444 | Bug | The new tab Provider has not been displayed when the Search ticket is initially loaded but only displayed when clicking on Clear. |

ADD-ON MODULE: CUSTOMER PORTAL

| ID | Classification | Feedback |
|-------|----------------|--|
| 39140 | Bug | Review of the Customer portal first page and the presentation of the most recently updated tickets, in order to address reported performance issues. |

ADD-ON MODULE: PATIENT & LOGISTIC

| ID | Classification | Feedback |
|-------|----------------|---|
| 39448 | Bug | When selecting a different address for the patient on the delivery order, and selecting a delivery address, an error message was presented. |
